

How can MALDI-TOF MS enhance the management of health issues related to indoor moulds ?

MALDI-TOF MS allowing a deeper look into the fungal diversity of the indoor air in Brussels dwellings

1. Mycology and Aerobiology, Sciensano, Brussels, Belgium • 2. Brussels Environment, Regional Intervention Cell for Indoor Pollution (RCIB/CRIP), Brussels, Belgium

In Belgium, recent factors such as energy-driven ventilation restrictions, the increasing prevalence of airtight building designs, and environmental change - including rising levels of rainfall - have contributed to higher indoor humidity levels, thereby exacerbating the risk and occurrence of indoor mould contamination

Comparison identification methods Microscopy versus MALDI-TOF MS

MALDI-TOF MS enables species-level mould identification, offering greater precision than microscopy
This advancement supports better understanding of indoor fungal diversity and may facilitate the development of targeted allergy diagnostics, ultimately enhancing the management of mould-related health issues
